Chapter Friction

Introduction

If we slide or try to slide a body over a surface, the motion is resisted by a bonding between the body and the surface. This resistance is represented by a single force and is called friction force.

The force of friction is parallel to the surface and opposite to the direction of intended motion.

Types of Friction

(1) Static friction : The opposing force that comes into play whe one body tends to move over the surface of another, but the actual motion has yet not started is called static friction.

(i) If applied force is P and the body remains at rest then static friction F = P.

(ii) If a body is at rest and no pulling force is acting on it, force of friction on it is zero.

Fig. 5.1

(iii) Static friction is a self-adjusting force because it changes itself in accordance with the applied force and is always equal to net external force.

(2) Limiting friction : If the applied force is increased, the force of static friction also increases. If the applied force exceeds a certain (maximum) value, the body starts moving. This maximum value of static friction upto which body does not move is called limiting friction.

(i) The magnitude of limiting friction between any two bodies in contact is directly proportional to the normal reaction between them.

 $F_l \propto R$ or $F_l = \mu_s R$

(ii) Direction of the force of limiting friction is always opposite to the direction in which one body is at the verge of moving over the other

(iii) Coefficient of static friction : (a) μ_s is called coefficient of static friction and is defined as the ratio of force of limiting friction and

normal reaction $\mu_s = \frac{F}{P}$

(b) Dimension : $[M^0L^0T^0]$

(c) Unit : It has no unit.

(d) Value of μ depends on material and nature of surfaces in contact that means whether dry or wet ; rough or smooth polished or nonpolished.

(e) Value of μ does not depend upon apparent area of contact.

(3) Kinetic or dynamic friction : If the applied force is increased further and sets the body in motion, the friction opposing the motion is called kinetic friction.

(i) Kinetic friction depends upon the normal reaction.

 $F_k \propto R$ or $F_k = \mu_k R$ where μ_k is called the coefficient of kinetic friction

(ii) Value of μ_k depends upon the nature of surface in contact.

(iii) Kinetic friction is always lesser than limiting friction $F_k < F_l$

 $\therefore \mu_k < \mu_s$

i.e. coefficient of kinetic friction is always less than coefficient of static friction. Thus we require more force to start a motion than to maintain it against friction. This is because once the motion starts actually ; inertia of rest has been overcome. Also when motion has actually started, irregularities of one surface have little time to get locked again into the irregularities of the other surface.

(iv) Kinetic friction does not depend upon the velocity of the body.

(v) Types of kinetic friction

(a) Sliding friction : The opposing force that comes into play when one body is actually sliding over the surface of the other body is called sliding friction. e.g. A flat block is moving over a horizontal table.

(b) Rolling friction : When objects such as a wheel (disc or ring), sphere or a cylinder rolls over a surface, the force of friction that comes into play is called rolling friction.

 \Box Rolling friction is directly proportional to the normal reaction (*R*) and inversely proportional to the radius (r) of the rolling cylinder or wheel.

$$F_{rolling} = \mu_r \frac{R}{r}$$

□ Rolling friction is often quite small as compared to the sliding friction. That is why heavy loads are transported by placing them on carts with wheels.

□ In rolling the surfaces at contact do not rub each other.

□ The velocity of point of contact with respect to the surface remains zero all the times although the centre of the wheel moves forward.

Graph Between Applied Force and Force of Friction

(1) Part OA of the curve represents static friction (F_s) . Its value increases linearly with the applied force

(2) At point A the static friction is maximum. This represent limiting friction (F_i) .

(3) Beyond *A*, the force of friction is seen to decrease slightly. The portion *BC* of the curve represents the kinetic friction (F_{ν}) .

(4) As the portion BC of the curve is parallel to *x*-axis therefore kinetic friction does

not change with the applied force, it remains constant, whatever be the applied force.

Friction is a Cause of Motion

It is a general misconception that friction always opposes the motion. No doubt friction opposes the motion of a moving body but in many cases it is also the cause of motion. For example :

(1) While moving, a person or vehicle pushes the ground backwards (action) and the rough surface of ground reacts and exerts a forward force due to friction which causes the motion. If there had been no friction there will be slipping and no motion.

(2) During cycling the rear wheel moves by the force communicated to it by pedalling while front wheel moves by itself. So, when pedalling a bicycle, the force exerted by rear wheel on ground makes force of friction act on it in the forward direction (like walking). Front wheel moving by itself experience force of friction in backward direction (like rolling of a ball). [However, if pedalling is stopped both wheels move by themselves and so experience force of friction in backward direction].

(3) If a body is placed in a vehicle which is accelerating, the force of friction is the cause of motion of the body along with the vehicle (*i.e.*, the body will remain at rest in the accelerating vehicle until

 $ma < \mu_s mg$). If there had been no friction between body and vehicle, the body will not move along with the vehicle.

Fig. 5.5

From these examples it is clear that without friction motion cannot be started, stopped or transferred from one body to the other.

Advantages and Disadvantages of Friction

- (1) Advantages of friction
- (i) Walking is possible due to friction.
- (ii) Two body sticks together due to friction.

Fig. 5.6 Fig. 5.7 (iii) Brake works on the basis of friction.

(iv) Writing is not possible without friction.

(v) The transfer of motion from one part of a machine to other part through belts is possible by friction.

(2) Disadvantages of friction

(i) Friction always opposes the relative motion between any two bodies in contact. Therefore extra energy has to be spent in over coming friction. This reduces the efficiency of machine.

(ii) Friction causes wear and tear of the parts of machinery in contact. Thus their lifetime reduces.

(iii) Frictional force result in the production of heat, which causes damage to the machinery.

Methods of Changing Friction

- We can reduce friction
- (1) By polishing.
- (2) By lubrication.
- (3) By proper selection of material.
- (4) By streamlining the shape of the body.
- (5) By using ball bearing.

Also we can increase friction by throwing some sand on slippery ground. In the manufacturing of tyres, synthetic rubber is preferred because its coefficient of friction with the road is larger.

Angle of Friction

Angle of friction may be defined as the angle which the resultant of limiting friction and normal reaction makes with the normal reaction.

By definition angle $\,\theta\,$ is called the angle of friction

$$\tan \theta = \frac{F_l}{R}$$

[As we know
$$\frac{F_l}{R} = \mu_s$$

1

or $\theta = \tan^{-1}(\mu_L)$

 \therefore tan $\theta = \mu$

Hence coefficient of static friction is equal to tangent of the angle of friction.

Resultant Force Exerted by Surface on Block

In the above figure resultant force
$$S = \sqrt{F^2 + R^2}$$

$$S = \sqrt{(\mu mg)^2 + (mg)^2}$$
$$S = mg\sqrt{\mu^2 + 1}$$

when there is no friction $(\mu = 0)$ *S* will be minimum

i.e.
$$S = mg$$

Hence the range of
$$S$$
 can be given by,
 $mg \le S \le mg \sqrt{\mu^2 + 1}$

Angle of Repose

By In

Angle of repose is defined as the angle of the inclined plane with horizontal such that a body placed on it is just begins to slide.

By resolving P in horizontal and vertical direction (as shown in figure)

For the condition of equilibrium

 $F = P \cos \alpha$ and $R = W - P \sin \alpha$

By substituting these value in $F = \mu R$

$$P\cos\alpha = \mu(W - P\sin\alpha)$$

$$\Rightarrow P \cos \alpha = \frac{\sin \theta}{\cos \theta} (W - P \sin \alpha) \qquad [\text{As } \mu = \tan \theta]$$

$$P = \frac{W \sin\theta}{\cos(\alpha - \theta)}$$

=

(2) Minimum pushing force P at an angle α from the horizontal

By Resolving P in horizontal and vertical direction (as shown in the figure) Fig. 5.12

such that a body placed on it is just begins to slide.
definition,
$$\alpha$$
 is called the angle of repose.
limiting condition $F = mg \sin \alpha$ and $R = mg \cos \alpha$
 $P \sin \alpha$
 W

So
$$\frac{F}{R} = \tan \alpha$$

 $\therefore \quad \frac{F}{R} = \mu_s = \tan \theta = \tan \alpha$ [As we know $\frac{F}{R} = \mu_s = \tan \theta$]

Thus the coefficient of limiting friction is equal to the tangent of angle of repose. $% \label{eq:coefficient}$

As well as $\alpha = \theta$ *i.e.* angle of repose = angle of friction.

Calculation of Required Force in Different Situation

If W = weight of the body, θ = angle of friction, $\mu = \tan \theta = \text{coefficient of friction}$

Then we can calculate required force for different situation in the following manner :

(1) Minimum pulling force P at an angle α from the horizontal

Fig. 5.13 For the condition of equilibrium

 $F = P \cos \alpha$ and $R = W + P \sin \alpha$

By substituting these value in $F = \mu R$

$$\Rightarrow P\cos\alpha = \mu(W + P\sin\alpha)$$

$$\Rightarrow P\cos\alpha = \frac{\sin\theta}{\cos\theta} (W + P\sin\alpha) \quad [\text{As } \mu = \tan\theta]$$

$$\Rightarrow P = \frac{W\sin\theta}{\cos(\alpha + \theta)}$$

=

(3) Minimum pulling force *P* to move the body up on an inclined plane

By Resolving P in the direction of the plane and perpendicular to the plane (as shown in the figure)

$$R + P\sin\alpha = W\cos\lambda$$

- $\therefore R = W \cos \lambda P \sin \alpha$ and $F + W \sin \lambda = P \cos \alpha$
- $\therefore \quad F = P\cos\alpha W\sin\lambda$
- By substituting these values in $F = \mu R$ and solving we get

$$P = \frac{W\sin(\theta + \lambda)}{\cos(\alpha - \theta)}$$

(4) Minimum force to move a body in downward direction along the surface of inclined plane

By Resolving P in the direction of the bar and perpendicular to the plane (as shown in the figure)

- $R + P\sin\alpha = W\cos\lambda$
- $\therefore R = W \cos \lambda P \sin \alpha$ and $P\cos\alpha + F = W\sin\lambda$
- $\therefore F = W \sin \lambda P \cos \alpha$

By substituting these values in $F = \mu R$ and solving we get

$$P = W \left[\frac{\sin(\lambda - \theta)}{\cos(\theta + \alpha)} \right]$$

(6) Minimum force for motion along horizontal surface and its direction

Fig. 5.20 Let the force *P* be applied at an angle α with the horizontal.

By resolving P in horizontal and vertical direction (as shown in figure)

Fig. 5.21
For vertical equilibrium

$$R + P \sin \alpha = mg$$

 $R + P \sin \alpha = mg$
 $\therefore R = mg - P \sin \alpha$...(i)
 $2 \cos \alpha \ge F$

Fig. 5.17 For the condition of equilibrium

 $R + P\sin\alpha = W\cos\lambda$

 $\therefore R = W\cos\lambda - P\sin\alpha$ and $F = P\cos\alpha + W\sin\lambda$

By substituting these values in $F = \mu R$ and solving we get

$$P = \frac{W\sin(\theta - \lambda)}{\cos(\alpha - \theta)}$$

(5) Minimum force to avoid sliding of a body down on an inclined

plane

By Resolving P in the directions of the plane and perpendicular to the plane (as shown in the figure)

Substituting value of
$$R$$
 from (i) in (ii)

$$P\cos\alpha \ge \mu(mg - P\sin\alpha)$$

$$P \ge \frac{\mu mg}{\cos \alpha + \mu \sin \alpha} \qquad \dots (iii)$$

For the force P to be minimum $(\cos \alpha + \mu \sin \alpha)$ must be maximum i.e.

 $\alpha = \tan^{-1}(\mu) =$ angle of friction or

i.e. For minimum value of P its angle from the horizontal should be equal to angle of friction

As
$$\tan \alpha = \mu$$
 so from the figure, $\sin \alpha = \frac{\mu}{\sqrt{1 + \mu^2}}$

and
$$\cos \alpha = \frac{1}{\sqrt{1 + \mu^2}}$$

By substituting these value in equation (iii)

SELF SCORER 232 Friction

$$P \ge \frac{\mu mg}{\frac{1}{\sqrt{1+\mu^2}} + \frac{\mu^2}{\sqrt{1+\mu^2}}} \ge \frac{\mu mg}{\sqrt{1+\mu^2}}$$

$$\therefore \quad P_{\min} = \frac{\mu m g}{\sqrt{1 + \mu^2}}$$

Acceleration of a Block Against Friction

$({\bf l})$ Acceleration of a block on horizontal surface

When body is moving under application of force P, then kinetic friction opposes its motion.

(2) Acceleration of a block sliding down over a rolightizelined plane

When angle of inclined plane is more than angle of repose, the body placed on the inclined plane slides down with an acceleration *a*.

From the figure
$$ma = mg \sin\theta - F$$

 $\Rightarrow ma = mg \sin\theta - \mu R$

$$\Rightarrow ma = mg \sin\theta - \mu mg \cos\theta$$

$$\therefore \text{ Acceleration } a = g [\sin \theta - \mu \cos \theta] \xrightarrow{mg \sin \theta}_{\theta mg} \frac{\pi g \cos \theta}{mg}$$

Note : For frictionless inclined plane $\mu = 0$ Fig: $g_{\overline{24}} g \sin \theta$ (3) Retardation of a block sliding up over a rough inclined plane

When angle of inclined plane is less than angle of repose, then for the upward motion ma =

$$ma = mg \sin\theta + F$$

 $ma = mg \sin\theta + \mu mg \cos\theta$

Retardation $a = g[\sin\theta + \mu\cos\theta]$

Note : \Box For frictionless inclined plane $\mu = 0$ $\therefore a = g \sin \theta$

 $mg\sin\theta + F$

 θ

 $mg \cos\theta$

Work done against friction

(1) Work done over a rough inclined surface

If a body of mass m is moved up slowly on a rough inclined plane through distance s, then

Work done = force \times distance

In the above expression if we put $\theta = 0$ then

Work done = force × distance = $F \times s = \mu mg s$

(i) Weight of the body. Fig. 5.27

 $(\ensuremath{\mathsf{ii}})$ Material and nature of surface in contact.

(iii) Distance moved.

Motion of Two Bodies one Resting on the Other

When a body A of mass m is resting on a body B of mass M then two conditions are possible

(1) A force ${\it F}\,{\rm is}$ applied to the upper body, (2) A force ${\it F}\,{\rm is}$ applied to the lower body

Fig. 5.28 We will discuss above two cases one by one in the following manner

(1) A force F is applied to the upper body, then following four situations are possible

(i) When there is no friction
(a) The body
$$A$$
 will move on body B with acceleration (Fm).

$$a_A = F/m$$

(b) The body *B* will remain at rest

$$a_{B} = 0$$

(c) If L is the length of B as shown in figure, A will fall from B after time t

$$t = \sqrt{\frac{2L}{a}} = \sqrt{\frac{2mL}{F}}$$
 $\left[\text{As s} = \frac{1}{2}at^2 \text{ and } a = F/m \right]$

(ii) If friction is present between A and B only and applied force is less than limiting friction (F < P)

(F = Applied force on the upper body, F = limiting friction between A and B, F = Kinetic friction between A and B)

(a) The body A will not slide on body B till $F < F_l$ i.e. $F < \mu_s mg$

(b) Combined system (m + M) will move together with common F

acceleration
$$a_A = a_B = \frac{1}{M+m}$$

(iii) If friction is present between A and B only and applied force is greater than limiting friction (F > F)

In this condition the two bodies will move in the same direction (*i.e.* of applied force) but with different acceleration. Here force of kinetic friction $\mu_k mg$ will oppose the motion of *A* while cause the motion of *B*.

Friction 233

Note : 🗖 As both the bodies are moving in the same direction.

Acceleration of body A relative to B will be

$$a = a_A - a_B = \frac{MF - \mu_k mg\left(m + M\right)}{mM}$$

So, A will fall from *B* after time

$$t = \sqrt{\frac{2L}{a}} = \sqrt{\frac{2 m ML}{MF - \mu_k mg (m + M)}}$$

(iv) If there is friction between B and floor

(where $F'_l = \mu'(M + m)g$ = limiting friction between *B* and floor, *F*_l = kinetic friction between *A* and *B*)

B will move only if
$$F_k > F'_l$$
 and then $F_k - F'_l = M a_B$
 $F'_l \leftarrow B$
 $F'_l \leftarrow F'_k \leftarrow C \leftarrow C$

However if *B* does not move then static friction will work (not limiting friction) between body *B* and the floor *i.e.* friction force = applied force (= *F*) not F'_i .

 $(2)\ {\sf A}$ force ${\it F}$ is applied to the lower body, then following four situations are possible

(i) When there is no friction

(a) *B* will move with acceleration (F/M) while *A* will remain at rest (relative to ground) as there is no pulling force on *A*.

$$a_B = \left(\frac{F}{M}\right)$$
 and $a_A = 0$

(b) As relative to *B*, *A* will move backwards with acceleration (*FM*) and so will fall from it in time t.

(ii) If friction is present between A and B only and
$$F' < F$$

(where F' = Pseudo force on body A and $F_{i} =$ limiting friction between body A and B_{i})

(a) Both the body will move together with common acceleration $a = \frac{F}{F}$

$$M+m$$

(b) Pseudo force on the body A,

$$F' = ma = \frac{mF}{m+M} \text{ and } F_l = \mu_s mg$$
(c) $F' < F_l \implies \frac{mF}{m+M} < \mu_s mg \implies F < \mu_s (m+M)g$

So both bodies will move together with acceleration

$$a_A = a_B = \frac{F}{m+M}$$
 if $F < \mu_s[m+M]g$

(iii) If friction is present between A and B only and F > F

(where $F_{i} = \mu_{i} mg$ = limiting friction between body *A* and *B*)

Both the body will move with different acceleration. Here force of kinetic friction $\mu_k mg$ will oppose the motion of *B* while will cause the motion of *A*.

Note : \Box As both the bodies are moving in the same direction

Acceleration of body A relative to B will be

$$a = a_A - a_B = -\left[\frac{F - \mu_k g(m+M)}{M}\right]$$

Negative sign implies that relative to B, A will move backwards and will fall it after time

$$t = \sqrt{\frac{2L}{a}} = \sqrt{\frac{2ML}{F - \mu_k g(m + M)}}$$

(iv) If there is friction between *B* and floor and $F > F''_{I}$:

(where $F'_{\mu} = \mu(m+M)g$ = limiting friction between body *B* and surface)

The system will move only if $F > F_l^{''}$ then replacing F by $F - F_l^{\, \prime \prime}$. The entire case (iii) will be valid.

However if $F < F_1''$ the system will not move and friction between *B* and floor will be *F* while between *A* and *B* is zero.

Motion of an Insect in the Rough Bowl

The insect crawl up the bowl, up to a certain height h only till the component of its weight along the bowl is balanced by limiting frictional force.

Let $m = \text{mass of the insect}, r = Figative soft the bowl, <math>\mu = \text{coefficient of}$ friction

for limiting condition at point A

$$R = mg \cos \theta$$
(i) and $F_l = mg \sin \theta$ (ii)
Dividing (ii) by (i)

$$\tan \theta = \frac{F_l}{R} = \mu \qquad [\operatorname{As} F_l = \mu R]$$

$$\therefore \quad \frac{\sqrt{r^2 - y^2}}{y} = \mu \quad \text{or} \quad y = \frac{r}{\sqrt{1 + \mu^2}}$$

So $h = r - y = r \left[1 - \frac{1}{\sqrt{1 + \mu^2}} \right], \quad \therefore \quad h = r \left[1 - \frac{1}{\sqrt{1 + \mu^2}} \right]$

Minimum Mass Hung from the String to Just Start the Motion

(1) When a mass *m* placed on a rough horizontal plane Another mass m_2 hung from the string connected by frictionless pulley, the tension (7) produced in string will try to start the motion of mass m_1

 \therefore $m_2 = \mu m_1$ this is the minimum value of m_2 to start the motion.

Note :
$$\Box$$
 In the above condition Coefficient of friction $\mu = \frac{m_2}{m_1}$

(2) When a mass m placed on a rough inclined plane Another mass m_2 hung from the string connected by frictionless pulley, the tension (T) produced in string will try to start the motion of mass m_1 .

For
$$m_2$$
 $T = m_2 g$

For
$$m_1$$
 $T = m_1 g \sin \theta + F$

$$\Rightarrow T = m_1 g \sin \theta + \mu R$$

 $\Rightarrow T = m_1 g \sin \theta + \mu m_1 g \cos \theta$...(ii)

From equation (i) and (ii) $m_2 = m_1[\sin\theta + \mu\cos\theta]$

this is the minimum value of m_2 to start the motion

Note $:\square$ In the above condition Coefficient of friction

$$\mu = \left[\frac{m_2}{m_1 \cos \theta} - \tan \theta\right]$$

Maximum Length of Hung Chain

We

is t

A uniform chain of length / is placed on the table in such a manner that its l' part is hanging over the edge of table without sliding. Since the chain have uniform linear density therefore the ratio of mass and ratio of length for any part of the chain will be equal.

e know
$$\mu = \frac{m_2}{m_1} = \frac{\text{mass hanging from the table}}{\text{mass lyingon the table}}$$

... For this case we can rewrite above expression in the following manner

Coefficient of Friction Between a Body and Wedge

A body slides on a smooth wedge of angle heta and its time of descent

Fig. 5.35 If the same wedge made rough then time taken by it to come down becomes *n* times more (*i.e. nt*)

The length of path in both the cases are same.

For smooth wedge,
$$S = u t + \frac{1}{2} a t^2$$

 $S = \frac{1}{2} (g \sin \theta) t^2$...(i)
[As $u = 0$ and $a = g \sin \theta$]

For rough wedge,
$$S = u t + \frac{1}{2} a t^2$$

$$S = \frac{1}{2}g(\sin\theta - \mu\cos\theta)(nt)^2 \qquad ...(ii)$$

[Asu = 0 and $a = g(\sin\theta - \mu\cos\theta)$]

From equation (i) and (ii)

...(i)

$$\frac{1}{2}(g\sin\theta)t^{2} = \frac{1}{2}g(\sin\theta - \mu\cos\theta)(nt)^{2}$$
$$\Rightarrow \sin\theta = (\sin\theta - \mu\cos\theta)n^{2}$$
$$\Rightarrow \mu = \tan\theta \left[1 - \frac{1}{n^{2}}\right]$$

Stopping of Block Due to Friction

(1) On horizontal road

(i) Distance travelled before coming to rest : A block of mass m is moving initially with velocity u on a rough surface and due to friction, it comes to rest after covering a distance S.

Fig. 5.37 Retarding force $F = ma = \mu R \implies ma = \mu mg$

$$\therefore a = \mu g$$

...

From $v^2 = u^2 - 2aS \implies 0 = u^2 - 2\mu gS$

$$S = \frac{u^2}{2\mu g} \quad \text{or} \quad S = \frac{P^2}{2\mu m^2 g}$$

As momentum
$$P = mu$$

[As v = 0, $a = \mu g$]

(ii) Time taken to come to rest

From equation $v = u - at \implies 0 = u - \mu g t$

$$[Asv = 0, a = \mu g]$$

 $\therefore t =$ μg (2) On inclined road : When block starts with velocity u its kinetic

energy will be converted into potential energy and some part of it goes against friction and after travelling distance S it comes to rest *i.e.* v = 0.

We know that retardation $a = g [\sin \theta + \mu \cos \theta]$

By substituting the value of *v* and *a* in the following equation

Stopping of Two Blocks Due to Friction

When two masses compressed towards each other and suddenly released then energy acquired by each block will be dissipated against friction and finally block comes to rest

i.e., $F \times S = E$ [Where F = Friction, S = Distance covered by block, *E* = Initial kinetic energy of the block]

$$\Rightarrow F \times S = \frac{P^2}{2m} \qquad [\text{Where } P = \text{momentum of block}]$$
$$\Rightarrow \mu mg \times S = \frac{P^2}{2m} \qquad [\text{As } F = \mu mg]$$
$$\Rightarrow S = \frac{P^2}{2\mu m^2 g}$$

In the given condition P and μ are same for both the blocks.

So,
$$S \propto \frac{1}{m^2}$$
; $\therefore \frac{S_1}{S_2} = \left[\frac{m_2}{m_1}\right]$

_

_

Velocity at the Bottom of Rough Wedge

A body of mass *m* which is placed at the top of the wedge (of height *h*) starts moving downward on a rough inclined plane.

Loss of energy due to friction = FL (Work against friction)

pseudo force (ma) acts on block toward left.

This force (*ma*) is action force by a block on cart.

Fig. 5.41 Now block will remain static *w.r.t.* cart. If friction force $\mu R \ge mg$

$$\Rightarrow \mu ma \ge mg \qquad [As R = ma]$$

$$\Rightarrow a \ge \frac{g}{\mu}$$
$$\therefore a_{\min} = \frac{g}{2}$$

fall.

This is the minimum acceleration of the cart so that block does not

and the minimum force to hold the block together

$$F_{\min} = (M+m)a_{\min}$$

$$F_{\min} = (M+m)\frac{g}{\mu}$$

Sticking of a Person with the Wall of Rotor

236 Friction

A person with a mass *m* stands in contact against the wall of a cylindrical drum (rotor). The coefficient of friction between the wall and the clothing is μ .

If Rotor starts rotating about its axis, then person thrown away from the centre due to centrifugal force at a particular speed ω , the person stuck to the wall even the floor is removed, because friction force balances its weight in this condition.

Friction force
$$(F)$$
 = weight of person (mg)
 $\Rightarrow \mu R = mg \Rightarrow \mu F_c = mg$
[Here, F = centrifugal force]
 $\Rightarrow \mu m \omega_{\min}^2 r = mg$
 $\therefore \omega_{\min} = \sqrt{\frac{g}{2}}$
Fig. 5.42

$$\omega_{\min} = \sqrt{\frac{\mu r}{\mu r}}$$

Fips & Tricks

Force of friction is non-conservative force. ø

Force of friction always acts in a direction opposite to that of the ø relative motion between the surfaces.

E Rolling friction is much less than the sliding friction. knowledge was used by man to invent the wheels.

E The friction between two surfaces increases (rather than to decrease), when the surfaces are made highly smooth.

🗷 The atomic and molecular forces of attraction between the two surfaces at the point of contact give rise to friction between the surfaces.

Ordinary Thinking **Objective Questions**

Static and limiting friction

- The coefficient of friction μ and the angle of friction λ are related 1. as
 - (a) $\sin \lambda = \mu$ (b) $\cos \lambda = \mu$
 - (c) $\tan \lambda = \mu$ (d) $\tan \mu = \lambda$
- A force of 98 N is required to just start moving a body of mass 100 2. kg over ice. The coefficient of static friction is
 - (a) 0.6 (b) 0.4
 - (d) 0.1 (c) 0.2
- A block weighs W is held against a vertical wall by applying a 3 horizontal force F. The minimum value of F needed to hold the block is [MP PMT 1993]

- (a) Less than W
- (c) Greater than *W*

- 14. The upper half of an inclined plane of inclination θ is perfectly smooth while the lower half is rough. A body starting from the rest at top comes back to rest at the bottom if the coefficient of friction for the lower half is given by

[Pb. PMT 2000]

(a) $\mu = \sin \theta$	(b) $\mu = \cot \theta$
(c) $\mu = 2 \cos \theta$	(d) μ = 2 tan θ

Friction 245 15. (c) 300 J (d) Zero A body is sliding down an inclined plane having coefficient of friction 0.5. If the normal reaction is twice 21. A 2 kg mass starts from rest on an inclined smooth that of the resultant downward force along the incline, the surface with inclination 30° and length 2 m. How much angle between the inclined plane and the horizontal is will it travel before coming to rest on a frictional surface [EAMCET (Engg.) 2000] with frictional coefficient of 0.25 (a) 15° (b) 30° (a) 4 m (b) 6 m (c) 45° (d) 60° (c) 8 m (d) 2 m 16. A body of mass 10 kg is lying on a rough plane inclined at 22. A block rests on a rough inclined plane making an angle an angle of 30° to the horizontal and the coefficient of of 30° with the horizontal. The coefficient of static friction friction is 0.5. the minimum force required to pull the between the block and the plane is 0.8. If the frictional body up the plane is [JIPMER 2000] force on the block is 10 N, the mass of the block (in kg) is (a) 914 N (b) 91.4 N (take $g = 10 m/s^2$) [AIEEE 2004] (c) 9.14 N (d) 0.914 N (a) 2.0 (b) 4.0 17. A block of mass 1 kg slides down on a rough inclined (c) 1.6 (d) 2.5 plane of inclination 60° starting from its top. If the 23. A body takes time t to reach the bottom of an inclined coefficient of kinetic friction is 0.5 and length of the plane plane of angle θ with the horizontal. If the plane is made is 1 *m*, then work done against friction is (Take g = 9.8rough, time taken now is 2t. The coefficient of friction of m/s^2) the rough surface is IAFMC 2000; KCET 20011 (a) (b) $-\tan\theta$ (a) 9.82 (c) $\frac{1}{4} \tan \theta$ (d) $\frac{1}{2} \tan \theta$ (c) 2.45J (d) 1.96 J 18. A block of mass 10 kg is placed on an inclined plane. 24. A block is kept on an inclined plane of inclination θ of When the angle of inclination is 30°, the block just begins to length /. The velocity of particle at the bottom of inclined slide down the plane. The force of static friction is is (the coefficient of friction is μ) [Kerala (Engg.) 2001] (a) $\sqrt{2gl(\mu\cos\theta - \sin\theta)}$ (b) $\sqrt{2gl}(\sin\theta - \mu\cos\theta)$ (a) 10 kg wt (b) 89 kg w (c) $\sqrt{2gl(\sin\theta + \mu\cos\theta)}$ (d) $\sqrt{2gl(\cos\theta + \mu\sin\theta)}$ (c) 49 kg wt (d) 5 kg wt A body of 5 kg weight kept on a rough inclined plane of 19. **Critical Thinking** angle 30° starts sliding with a constant velocity. Then the Objective Questions coefficient of friction is (assume $g = 10 m/s^2$) IJIPMER 20021 (a) $1/\sqrt{3}$ (b) $2/\sqrt{3}$ (c) $\sqrt{3}$ (d) $2\sqrt{3}$ 1. A block of mass *m* lying on a rough horizontal plane is 20. 300 Joule of work is done in sliding up a 2 kg block on an acted upon by a horizontal force P and another force Qinclined plane to a height of 10 metres. Taking value of inclined at an angle θ to the vertical. The block will acceleration due to gravity 'd to be 10 m/s², work done remain in equilibrium, if the coefficient of friction between

it and the surface is

[MP PMT 2002]

(a) 100 J (b) 200 J

against friction is

[Haryana CEE 1996]

- $(P + Q \sin \theta)$ (a)
- $(mg + Q\cos\theta)$ $(P\cos\theta + Q)$ (b)

- $(P\sin\theta Q)$ (d) $(mg - O\cos\theta)$
- 2. Which of the following is correct, when a person walks on a rough surface [IIT 1981]
 - (a) The frictional force exerted by the surface keeps him moving

M

- (b) The force which the man exerts on the floor keeps him moving
- (c) The reaction of the force which the man exerts on floor keeps him moving
- (d) None of the above
- 3. A block of mass 0.1 kg is held against a wall by applying a horizontal force of 5 N on the block. If the coefficient of friction between the block and the wall is 0.5, the magnitude of the frictional force acting on the block is[IIT 1994]

(a	25N	(b) 0.98 N
(0) 2.0 /	(0) 0.30 /

- (c) 4.9 N (d) 0.49 N
- 4. A body of mass *M* is kept on a rough horizontal surface (friction coefficient μ). A person is trying to pull the body by applying a horizontal force but the body is not moving. The force by the surface on the body is F, where

[MP PET 1997]

- (a) F = Mg(b) $F = \mu Mgf$
- (c) $Mg \le F \le Mg\sqrt{1+\mu^2}$ (d) $Mg \ge F \ge Mg\sqrt{1+\mu^2}$
- 5. What is the maximum value of the force F such that the block shown in the arrangement, does not move

[IIT-JEE Screening 2003]

(a) 20 <i>N</i>	(b) 10 <i>N</i>
(c) 12 N	(d) 15 <i>N</i>

6. A block P of mass m is placed on a frictionless horizontal surface. Another block Q of same mass is kept on P and connected to the wall with the help of a spring of spring constant k as shown in the figure. μ_s is the coefficient of friction between P and Q. The blocks move together performing SHM of amplitude A. The maximum value of the friction force between P and Q is

[IIT-JEE (Screening) 2004]

coefficient of friction between the body and the surface is μ . If the mass is pulled by a force *P* as shown in the figure, the limiting friction between body and surface will be

[BHU 2004]

A 40 kg slab rests on a frictionless floor as shown in the figure. A 10 kg block rests on the top of the slab. The static coefficient of friction between the block and slab is 0.60 while the kinetic friction is 0.40. The 10 kg block is acted upon by a horizontal force 100 N. If $g = 9.8 m / s^2$, the resulting acceleration of the slab will be [NCERT 1982]

- (a) $0.98 m / s^2$
- (b) 1.47 m / s^2
- (c) $1.52 m / s^2$

- (d) $6.1 m / s^2$
- 9. A block of mass 2 kg rests on a rough inclined plane making an angle of 30° with the horizontal. The coefficient of static friction between the block and the plane is 0.7. The frictional force on the block is [IIT 1980; J & K CET 2004] (a) 9.8 N
 - (b) $0.7 \times 9.8 \times \sqrt{3} N$
 - (c) $9.8 \times \sqrt{3} N$
 - (d) $0.8 \times 9.8 N$
- **10.** When a bicycle is in motion, the force of friction exerted by the ground on the two wheels is such that it acts
 - [IIT 1990; Manipal MEE 1995; MP PET 1996]
 - (a) In the backward direction on the front wheel and in the forward direction on the rear wheel
 - (b) In the forward direction on the front wheel and in the backward direction on the rear wheel
 - (c) In the backward direction on both front and the rear wheels

(d) In the forward direction on both front and the rear wheels

- 11. An insect crawls up a hemispherical surface very slowly (see the figure). The coefficient of friction between the insect and the surface is 1/3. If the line joining the centre of the hemispherical surface to the insect makes an angle α with the vertical, the maximum possible value of α is given by [IIT-JEE 2001]
 - (a) $\cot \alpha = 3$
 - (b) $\tan \alpha = 3$
 - (c) $\sec \alpha = 3$
 - (d) $\csc \alpha = 3$

Read the assertion and reason carefully to mark the correct option out of the options given below:

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
- (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
- (c) If assertion is true but reason is false.
- (d) If the assertion and reason both are false.
- (e) If assertion is false but reason is true.

Assertion

- Assertion : On a rainy day, it is difficult to drive a car or bus at high speed.
 - Reason : The value of coefficient of friction is lowered due to wetting of the surface.
- Assertion : When a bicycle is in motion, the force of friction exerted by the ground on the two wheels is always in forward direction.

Reason : The frictional force acts only when the bodies are in contact.

: Pulling a lawn roller is easier than pushing it.

- Reason : Pushing increases the apparent weight and hence the force of friction.
- Assertion : Angle of repose is equal to angle of limiting friction.
 - Reason : When the body is just at the point of motion, the force of friction in this stage is called as limiting friction.
- 5. Assertion : Two bodies of masses M and m (M > m) are allowed to fall from the same height if the air resistance for each be the same then both the bodies will reach the earth simultaneously.
 - Reason : For same air resistance, acceleration of both the bodies will be same.

6. Assertion : Friction is a self adjusting force.

Reason	:	Friction does not depend upon mass of the body.
Assertion	:	The value of dynamic friction is less than the limiting friction.
Reason	:	Once the motion has started, the inertia of rest has been overcome.
Assertion	:	The acceleration of a body down a rough inclined plane is greater than the acceleration due to gravity.
	Reason Assertion Reason Assertion	Reason:Assertion:Reason:Assertion:

: The body is able to slide on a inclined plane Reason only when its acceleration is greater than acceleration due to gravity.

Motion on Inclined Surface

15. (a)
$$\mu = \frac{m_B}{m_A} \Rightarrow 0.2 = \frac{m_B}{10} \Rightarrow m_B = 2kg$$

16. (d) Work done by friction can be positive, negative and zero depending upon the situation.

17. (c)
$$\mu = \frac{\text{Lenght of chain hanging from the table}}{\text{Lenght of chain lyingon the table}} = \frac{l}{L-l}$$

- (b) Surfaces always slide over each other.
- (a) Coefficient of friction $\mu_s = \frac{F_l}{R} = \frac{75}{mg} = \frac{75}{20 \times 9.8} = 0.38$

(a) Retarding force
$$F = ma = \mu R = \mu mg$$
 $\therefore a = \mu g$

з.

-

Now from equation of motion $v^2 = u^2 - 2as$

$$\Rightarrow 0 = u^2 - 2as \Rightarrow s = \frac{u^2}{2a} = \frac{u^2}{2\mu g} \therefore = \frac{v_0^2}{2\mu g}$$

4. (d) Net force = Applied force – Friction force $ma = 24 - \mu mg = 24 - 0.4 \times 5 \times 9.8 = 24 - 19.6$

$$\Rightarrow a = \frac{4.4}{5} = 0.88 \ m/s^2$$

5. (a) Work done = Force × Displacement = $\mu mg \times (v \times t)$

$$W = (0.2) \times 2 \times 9.8 \times 2 \times 5$$
 joule

Heat generated
$$Q = \frac{W}{J} = \frac{0.2 \times 2 \times 9.8 \times 2 \times 5}{4.2} = 9.33$$
 cal

6. (c) For given condition $s \propto \frac{1}{m^2}$ $\therefore \frac{s_2}{s_1} = \left(\frac{m_1}{m_2}\right)^2 = \left(\frac{200}{300}\right)^2$

$$\Rightarrow \quad s_2 = s_1 \times \frac{4}{9} = 36 \times \frac{4}{9} = 16 m$$

(a) There is no friction between the body *B* and surface of the table. If the body *B* is pulled with force *F* then

$$F = (m_A + m_B)a$$

Due to this force upper body *A* will feel the pseudo force in a backward direction.

But due to friction between A and B, body will not move. The body A will start moving when pseudo force is more than friction force.

i.e. for slipping,
$$m_A a = \mu m_A g \therefore a = \mu g$$

8. (d) Limiting friction $= \mu_s R = \mu_s mg = 0.5 \times 60 \times 10 = 300 N$

Kinetic friction $= \mu_k R = \mu_k mg = 0.4 \times 60 \times 10 = 240 N$

Force applied on the body = 300 N and if the body is moving then, Net accelerating force

=Applied force – Kinetic friction

$$\Rightarrow ma = 300 - 240 = 60$$
 $\therefore a = \frac{60}{60} = 1 m/s^2$

9. (a)
$$v = \sqrt{\mu g r} \Rightarrow r = \frac{v^2}{\mu g} = \frac{100}{0.5 \times 10} = 20$$

10. (b)

12.

(d)

n. (b)
$$S = \frac{u^2}{2\mu g} = \frac{(10)^2}{2 \times 0.2 \times 10} = 25 \ m$$

$$F \cos 30^{\circ}$$

For limiting condition $f^{\underline{mg}}\mu R$

 $F\sin 30^\circ = \mu(mg - F\cos 30^\circ)$, By solving F = 294.3 N

$$ma = F - \mu_k mg \Rightarrow \mu_k = \frac{F - ma}{mg} = \frac{129.4 - 10 \times 10}{10 \times 9.8} = 0.3$$

14. (c)
$$v = \sqrt{\mu g r} = \sqrt{0.5 \times 9.8 \times 40} = \sqrt{196} = 14 \ m/s$$

15. (b)
$$s = \frac{u^2}{2\mu g} = \frac{(20)^2}{2 \times 0.5 \times 10} = 40 \ m$$

6. (d) Net force in forward direction = Accelerating force + Friction
=
$$ma + \mu mg = m(a + \mu g) = (1500 + 500)(1 + 0.2 \times 10)$$

= $2000 \times 3 = 6000 N$

17. (b)
$$v = \sqrt{\mu rg} = \sqrt{0.4 \times 30 \times 9.8} = 10.84 \ m/s$$

18. (a)
$$W = \mu mgS = 0.2 \times 50 \times 9.8 \times 1 = 98 J$$

19. (a)
$$F_l = \mu mg = 0.6 \times 1 \times 9.8 = 5.88 N$$

Pseudo force on the block = $ma = 1 \times 5 = 5 N$

Pseudo is less then limiting friction hence static force of friction = 5 N.

(d)
$$S = \frac{u^2}{2\mu g} = \frac{m^2 u^2}{2\mu g m^2} = \frac{P^2}{2\mu m^2 g}$$

21. (d) Weight of the body = 64N

so mass of the body $m = 6.4 \ kg$, $\mu_s = 0.6$, $\mu_k = 0.4$

Net acceleration
$$=$$
 $\frac{\text{Appliedforce - Kineticfriction}}{\text{Mass of the body}}$

$$=\frac{\mu_s mg - \mu_k mg}{m} = (\mu_s - \mu_k)g = (0.6 - 0.4)g = 0.2g$$

23.

10

20

(b)
$$a = \frac{\text{Appliedforce} - \text{Kineticfriction}}{1 + \frac{1}{2}}$$

$$\begin{array}{c} 1 \\ 24. \\ (b) \end{array} = \begin{array}{c} \frac{100 - 0.5 \times 10 \times 10}{10} = 5m/s^2 \end{array}$$

25. (d)
$$v = u - at \Rightarrow u - \mu gt = 0$$
 \therefore $\mu = \frac{u}{gt} = \frac{6}{10 \times 10} = 0.06$

mass

26. (b) From the relation $F - \mu mg = ma$

$$a = \frac{F - \mu mg}{m} = \frac{129.4 - 0.3 \times 10 \times 9.8}{10} = 10 \ m \ / \ s^2$$

27. (b) Let body is dragged with force *P*, making an angle 60° with the horizontal.

$$\begin{array}{c} R \quad P \sin 60^{\circ} \\ \uparrow \quad P \\ \hline \\ F_{k} \\ \hline \\ F_{k} \\ \hline \end{array}$$

 F_k = Kinetic friction in the motion = $\mu_k R$

From the figure $F_k = P \cos 60^\circ$ and $R = mg - P \sin 60^\circ$

$$\therefore P\cos 60^\circ = \mu_{\rm b} (mg - P\sin 60^\circ)$$

$$\Rightarrow \frac{P}{2} = 0.5 \left(60 \times 10 - \frac{P\sqrt{3}}{2} \right) \Rightarrow P = 315.1 N$$

$$\therefore F_k = P \cos 60^\circ = \frac{315.1}{2} N$$

Work done = $F_k \times s = \frac{315.1}{2} \times 2 = 315$ Joule

28. (d)
$$v = u - at \Rightarrow t = \frac{u}{a}$$
 [As $v = 0$]
 $t = \frac{u \times m}{F} = \frac{30 \times 1000}{5000} = 6 \text{ sec}$

(c) (b) Kinetic energy acquired by body = (Total work done on the body) – (work against friction) = $F \times S - \mu mgS = 25 \times 10 - 0.2 \times 5 \times 10 \times 10$ = 250 - 100 = 150 Joule

31. (a)
$$v = \sqrt{\mu r g} = \sqrt{0.5 \times 500 \times 10} = 50 \ m/s$$

32. (d) Net downward acceleration
$$= \frac{\text{Weight-Friction force}}{\text{Mass}}$$

$$= \frac{(mg - \mu R)}{m}$$

$$= \frac{60 \times 10 - 0.5 \times 600}{60}$$

$$= \frac{300}{60} = 5 m/s^{2}$$

$$R \longleftarrow 600N$$

(a)

29. 30.

$$F_{k} = 0.2(55 \times 10 - 40 \times \frac{1}{2}) = 0.2(50 - 20) = 6 P$$

Acceleration of the block = $\frac{F \cos 30^\circ - \text{Kinetic friction}}{\text{Mass}}$

$$=\frac{40\times\frac{\sqrt{3}}{2}-6}{5}=5.73\ m/s^2$$

34. (b) We know
$$s = \frac{u^2}{2\mu g}$$
 \therefore $\mu = \frac{u^2}{2gs} = \frac{(6)^2}{2 \times 10 \times 9} = 0.2$

35. (d)
$$s = \frac{u^2}{2\mu g} = \frac{(100)^2}{2 \times 0.5 \times 10} = 1000 m$$

36. (d) Kinetic energy of the cylinder will go against friction

$$\therefore \ \frac{1}{2}mv^2 = \mu \ mgs \implies s = \frac{u^2}{2\mu \ g} = \frac{(10)^2}{2 \times (0.5) \times 10} = 10 \ m$$

Motion on Inclined Surface

1. (b) When the body is at rest then static friction works on it, which is less than limiting friction (μR) .

2. (b)

3. (c) Coefficient of friction = Tangent of angle of repose $\therefore \mu = \tan \theta$

(a)
$$\mu = \tan \theta \left(1 - \frac{1}{n^2} \right) = 1 - \frac{1}{n^2}$$
 [As $\theta = 45^\circ$]

4

(a) Retardation in upward motion = $g(\sin\theta + \mu\cos\theta)$ 5. \therefore Force required just to move up $F_{up} = mg(\sin\theta + \mu\cos\theta)$ Similarly for down ward motion $a = g(\sin\theta - \mu\cos\theta)$... Force required just to prevent the body sliding down $F_{dn} = mg(\sin\theta - \mu\cos\theta)$ According to problem $F_{up} = 2F_{dn}$ $\Rightarrow mg(\sin\theta + \mu\cos\theta) = 2mg(\sin\theta - \mu\cos\theta)$ $\Rightarrow \sin\theta + \mu \cos\theta = 2\sin\theta - 2\mu \cos\theta$ $\Rightarrow 3\mu\cos\theta = \sin\theta \Rightarrow \tan\theta = 3\mu$ $\Rightarrow \theta = \tan^{-1}(3\mu) = \tan^{-1}(3 \times 0.25) = \tan^{-1}(0.75) = 36.8^{\circ}$ (c) $\mu = \tan \theta \left(1 - \frac{1}{n^2} \right)$ 6. $\theta = 45^{\circ}$ and n = 2 (Given) $\therefore \ \mu = \tan 45^{\circ} \left(1 - \frac{1}{2^2} \right) = 1 - \frac{1}{4} = \frac{3}{4} = 0.75$ (a) $a = g(\sin\theta - \mu\cos\theta) = 9.8(\sin 45^{\circ} - 0.5\cos 45^{\circ})$ 7. m/\sec^2 angle of inclination is equal to or more than angle of repose then box will automatically slides down the plane. (d) 9. $mg\cos \theta$ θ mg Net force along the plane

$$P - mg\sin\theta = 750 - 500 = 250 N$$

Limiting friction = $F_l = \mu_s R = \mu_s mg \cos \theta$

 $= 0.4 \times 102 \times 9.8 \times \cos 30 = 346 N$

As net external force is less than limiting friction therefore friction on the body will be 250 N.

10. (c)
$$a = g(\sin\theta - \mu\cos\theta) = 10(\sin60^\circ - 0.25\cos60^\circ)$$

 $a = 7.4 \ m/s^2$

(b)
$$F_k = \mu_k R = \mu_k mg \cos \theta$$

11.

$$F_{k} = 1.7 \times 0.1 \times 10 \times \cos 30^{\circ} = 1.7 \times \frac{\sqrt{3}}{2} N$$

12. (a)
$$\mu = \tan \theta \left(1 - \frac{1}{n^2} \right) = \tan 30 \left(1 - \frac{1}{2^2} \right) = \frac{\sqrt{3}}{4}$$

13. (a) For angle of repose, Friction =Component of weight along the plane

$$\begin{aligned} - \frac{mg \sin \theta}{r^{2}} = \frac{2 \times 9.8 \times \sin 45^{\circ}}{r^{2}} = \frac{126 \sin 49^{\circ}}{r^{2}} = \frac{12}{r^{2}} \sin \theta} \\ re lower half \\ \Rightarrow 0 = u^{2} + 2g (\sin \theta - \mu \cos \theta) \frac{1}{2} \\ \frac{1}{r^{2}} = \frac{1}{r^{2}} + 2g (\sin \theta - \mu \cos \theta) \frac{1}{2} \\ \frac{1}{r^{2}} = \frac{1}{r^{2}} + 2g (\sin \theta - \mu \cos \theta) \frac{1}{2} \\ \frac{1}{r^{2}} = \frac{1}{r^{2}} + 2g (\sin \theta - \mu \cos \theta) \frac{1}{2} \\ \frac{1}{r^{2}} = \frac{1}{r^{2}} + 2g (\sin \theta - \mu \cos \theta) \frac{1}{2} \\ \frac{1}{r^{2}} = \frac{1}{r^{2}} + 2g (\sin \theta - \mu \cos \theta) \frac{1}{2} \\ \frac{1}{r^{2}} = \frac{1}{r^{2}} + 2g (\sin \theta - \mu \cos \theta) \frac{1}{r^{2}} \\ \frac{1}{r^{2}} = \frac{1}{r^{2}} + 2g (\sin \theta - \mu \cos \theta) \frac{1}{r^{2}} \\ \frac{1}{r^{2}} = \frac{1}{r^{2}} + 2g (\sin \theta - \mu \cos \theta) \frac{1}{r^{2}} \\ \frac{1}{r^{2}} = \frac{1}{r^{2}} + 2g (\sin \theta - \mu \cos \theta) \frac{1}{r^{2}} \\ \frac{1}{r^{2}} = \frac{1}{r^{2}} + 2g (\sin \theta - \mu \cos \theta) \frac{1}{r^{2}} \\ \frac{1}{r^{2}} = 1 + 2A \sin^{2} + 2A \sin^{2} + 1 + 2A \sin^{2} + 1 + 2A \sin^{2} + 1 + 2A \sin^{2} + 2A \sin^{2} + 1 + 2A \sin^{2} + 1 + 2A \sin^{2} + 2A$$

F e

 $P = P = P \cos 30^{\circ}$

↓ mg

$$v = \sqrt{2as} = \sqrt{2gl(\sin\theta - \mu\cos\theta)}$$

opposite to its weight. Thus weight is reduced. So pulling is easier than pushing the lawn roller.

 \therefore Limiting friction between body and surface is given by,

$$F = \mu R = \mu \left(mg - \frac{P}{2} \right).$$

8. (a) Limiting friction between block and slab = $\mu_s m_A g$

 $= 0.6 \times 10 \times 9.8 = 58.8N$

But applied force on block A is 100 N. So the block will slip over a slab.

Now kinetic friction works between block and slab $F_k = \mu_k m_A g = 0.4 \times 10 \times 9.8 = 39.2 \ N$

This kinetic friction helps to move the slab

: Acceleration of slab =
$$\frac{39.2}{m_B} = \frac{39.2}{40} = 0.98 \ m / s^2$$

9. (a) Limiting friction $F_l = \mu mg \cos \theta$

 $F_l = 0.7 \times 2 \times 10 \times \cos 30^\circ = 12 \ N$ (approximately)

But when the block is lying on the inclined plane then component of weight down the plane $= mg \sin\theta$

$$= 2 \times 9.8 \times \sin 30^\circ = 9.8 N$$

It means the body is stationary, so static friction will work on it \therefore Static friction = Applied force = 9.8 *N*

10. (a,c) In cycling, the rear wheel moves by the force communicated to it by pedalling while front wheel moves by it self. So, while pedalling a bicycle, the force exerted by rear wheel on ground makes force of friction act on it in the forward direction (like walking). Front wheel moving by itself experience force of friction in backward direction (like rolling of a ball). [However, if pedalling is stopped both wheels move by themselves and so experience force of friction in backward direction].

11. (a)

Assertion & Reason

- (a) On a rainy day, the roads are wet. Wetting of roads lowers the coefficient of friction between the tyres and the road. Therefore, grip of car on the road reduces and thus chances of skidding increases.
- **2.** (e) When a bicycle is in motion, two cases may arise :

(i) When the bicycle is being pedalled. In this case, the applied force has been communicated to rear wheel. Due to which the rear wheel pushes the earth backwards. Now the force of friction acts in the forward direction on the rear wheel but front wheel move forward due to inertia, so force of friction works on it in backward direction

(ii) When the bicycle is not being pedalled :

In this case both the wheels move in forward direction, due to inertia. Hence force of friction on both the wheels acts in backward direction.

(a) Suppose the roller is pushed as in figure (b). The force F is resolved into two components, horizontal component F which helps the roller to move forward, and the vertical component acting downwards adds to the weight. Thus weight is increased. But in the case of pull [fig (a)] the vertical component is

(d) The force acting on the body of mass *M* are its weight *Mg* acting vertically downwards and air resistance *F* acting vertically upward.

 \therefore Acceleration of the body, $a = \frac{Mg - F}{M} = g - \frac{F}{M}$

Now, M > m, therefore, the body with larger mass will have greater acceleration and it will reach the ground first.

(d) Only static friction is a self adjusting force. This is because force of static friction is equal and opposite to applied force (so long as actual motion does not start). Frictional force = μmg *i.e.* friction depends on mass.

ET Self Evaluation Test - 5

- A force of 19.6 N when applied parallel to the surface just moves a 1. body of mass 10 kg kept on a horizontal surface. If a 5 kg mass is kept on the first mass, the force applied parallel to the surface to just move the combined body is
 - (a) 29.4 N (b) 39.2 N
 - (c) 18.6 N (d) 42.6 N
- 2. If the normal force is doubled, the coefficient of friction is
 - (a) Not changed (b) Halved
 - (c) Doubled (d) Tripled
- A body of weight 50 N placed on a horizontal surface is just moved 3. by a force of 28.2 N. The frictional force and the normal reaction are
 - (a) 10 N, 15 N
 - 28.2 N 20 N, 30 N (b) 2 N, 3 N (c) (d) 5 N, 6 N 50 N
- 4. Block A weighing 100 kg rests on a block B and is tied with a horizontal string to the wall at C. Block B weighs 200 kg. The coefficient of friction between A and B is 0.25 and between B and the surface is 1/3. The horizontal force P necessary to move the block B should be $(g = 10 m / s^2)$
 - (a) 1150 N
 - (b) 1250 N
 - (c) 1300 N
 - 1420 N (d)
- A rough vertical board has an acceleration a so that a 2 kg block 5 pressing against it does not fall. The coefficient of friction between the block and the board should be
 - (a) > g/a

 - (b) $\langle g/a$
 - (c) = g/a
 - (d) > a/g
- 6. A stone weighing 1 kg and sliding on ice with a velocity of 2 m/s is stopped by friction in 10 sec. The force of friction (assuming it to be constant) will be
 - -20 N(a) (b) -0.2 N

a←
2 kg

R

- (c) 0.2 N (d) 20 N 7.
 - A body of mass 10 kg slides along a rough horizontal surface. The coefficient of friction is $1/\sqrt{3}$. Taking $g = 10 m / s^2$, the least force which acts at an angle of 30° to the horizontal is
 - (a) 25 N (b) 100 N
 - (d) $\frac{50}{\sqrt{3}}N$ (c) 50 N
- 8. A lift is moving downwards with an acceleration equal to acceleration due to gravity. A body of mass M kept on the floor of the lift is pulled horizontally. If the coefficient of friction is μ , then the frictional resistance offered by the body is
 - (a) Mg (b) μMg
 - (c) $2\mu Mg$ (d) Zero
 - In the above question, if the lift is moving upwards with a uniform velocity, then the frictional resistance offered by the body is
 - (a) Mg (b) μMg
 - (c) $2\mu Mg$ (d) Zero

9.

14.

- A body of mass 2 kg is moving on the ground comes to rest after 10. some time. The coefficient of kinetic friction between the body and the ground is 0.2. The retardation in the body is
 - (b) **4**.73 m / s^2 (a) 9.8 m/s^2
 - (c) $2.16 m / s^2$ (d) $1.96 m/s^2$

cyclist moves in a circular track of radius 100 *m*. If the coefficient of friction is 0.2, then the maximum velocity with which the cyclist can take the turn with leaning inwards is

- (a) 9.8 *m*/*s* (b) 1.4 *m*/*s*
- (c) 140 m/s (d) 14 m/s
- 12 A block of mass 5 kg lies on a rough horizontal table. A force of 19.6 N is enough to keep the body sliding at uniform velocity. The coefficient of sliding friction is
 - (b) 0.2 (a) 0.5
 - (c) 0.4 (d) 0.8
- 13. A motor car has a width 1.1 *m* between wheels. Its centre of gravity is 0.62 m above the ground and the coefficient of friction between the wheels and the road is 0.8. What is the maximum possible speed, if the centre of gravity inscribes a circle of radius 15 m? (Road surface is horizontal)
 - (b) 6.28 *m*/*s* (a) 7.64 *m*/*s*
 - (c) 10.84 *m/s* (d) 11.23 m/s

A child weighing 25 kg slides down a rope hanging from the branch of a tall tree. If the force of friction acting against him is 2 N, what is the acceleration of the child (Take $g = 9.8 m / s^2$)

- (a) $22.5 m / s^2$ (b) $8 m / s^2$
- (c) $5 m / s^2$ (d) $9.72 m / s^2$

LF SCORER 252 Friction

3.

1. (a) $F_l \propto R$ \therefore $F_l \propto m$ *i.e.* limiting friction depends upon the mass of body. So, $\frac{(F_l)'}{(F_l)} = \frac{m'}{m} = \frac{10+5}{10}$ $\Rightarrow (F_l)' = \frac{3}{2} \times F_l = \frac{3}{2} \times 19.6 = 29.4 N$

(a) Coefficient of friction is constant for two given surface in contact. It does not depend upon the weight or normal reaction.

(b) $f \leftarrow 28.2 \sin 45^{\circ}$ $f \leftarrow 50 N$ Frictional force = $f = 28.2 \cos 45^{\circ} = 28.2 \times \frac{1}{\sqrt{2}} = 20 N$

Normal reaction $R = 50 - 28.2 \sin 45^\circ = 30 N$

(b) Friction between block *A* and block *B* & between block *B* and surface will oppose the *P*

$$\therefore P = F_{AB} + F_{BS} = \mu_{AB}m_Ag + \mu_{BS}(m_A + m_B)g$$
$$= 0.25 \times 100 \times 10 + \frac{1}{3}(100 + 200) \times 10 = 1250 \text{ N}$$

5. (a) For the limiting condition upward friction force between board and block will balance the weight of the block.

 $P\cos 30^\circ = \mu(mg - P\sin 30^\circ)$

$$\Rightarrow P \frac{\sqrt{3}}{2} = \frac{1}{\sqrt{3}} \left(100 - P \frac{1}{2} \right) \Rightarrow \frac{3P}{2} = \left(100 - \frac{P}{2} \right)$$

 $\Rightarrow 2P = 100 \therefore P = 50 N$

8. (d) R = m(g - a) for downward motion of lift

If a = g then R = 0 \therefore $F = \mu R = 0$

- 9. (b) When the lift is moving upward with constant velocity then, $R = mg \quad \because \quad F = \mu \ R = \mu \ mg$
- 10. (d) We know that $a = \mu g = 0.2 \times 9.8 = 1.96 \ m / s^2$

n. (d)
$$v = \sqrt{\mu r g} = \sqrt{0.2 \times 100 \times 10} = 10\sqrt{2} = 14 \ m/s$$

12. (c)
$$\mu_k = \frac{F}{R} = \frac{19.6}{5 \times 9.8} = \frac{2}{5} = 0.4$$

13. (c)
$$v = \sqrt{\mu} g r = \sqrt{0.8 \times 9.8 \times 15} = 10.84 m/s$$

14. (d) Net downward force = Weight – Friction

:.
$$ma = 25 \times 9.8 - 2 \implies a = \frac{25 \times 9.8 - 2}{25} = 9.72 \ m/s^2$$

i.e.
$$F > mg$$

 $\Rightarrow \mu(R) > mg$
 $\Rightarrow \mu(ma) > mg$
 $\Rightarrow \mu > \frac{g}{a}$

6. (b) u = 2 m / s, v = 0, t = 10 sec

$$\therefore \ a = \frac{v - u}{t} = \frac{0 - 2}{10} = -\frac{2}{10} = -\frac{1}{5} = -0.2 \ m \ / \ s^2$$

 \therefore Friction force = $ma = 1 \times (-0.2) = -0.2 N$

7. (c) Let *P* force is acting at an angle 30° with the horizontal.

For the condition of motion $F = \mu R$
